UNIDADES DE GERENCIAMENTO DE RECURSOS HÍDRICOS  
AGRUPADAS POR REGIÃO HIDROGRÁFICA

**Legenda**

**Regiões Hidrográficas**

- Bacia do Rio Paraíba do Sul
- Bacia do Rio Tietê
- Vertente Litorânea
- Vertente Paulista do Rio Grande
- Vertente Paulista do Rio Grande/São José dos Dourados
- Aguapeí/Peixe
- Vertente Paulista do Rio Paranapanema

**Unidade de Gerenciamento de Recursos Hídricos**

- Limite UGRHI

Contexto espacial

Estado inserido em 3 Regiões

Hidrográficas Brasileiras: Rio Paraná;  
Atlântico Sudeste e Atlântico Sul

- 7 Regiões Hidrográficas Estaduais (vertentes);
- 22 Unidades de Gerenciamento de Recursos Hídricos (UGRHI);
- 9 Regiões Metropolitanas;
- 645 municípios;
- 45,1 milhões de habitantes

# Metodologia

Coleta dados da chuva diária raster (Merge/INPE): combinação da precipitação observada (pluviômetros) com estimativa de precipitação por satélite.

Processamento com uma biblioteca para dados geoespaciais (GDAL)

Obtenção da chuva diária e mensal na área da UGRHI

Cálculo de indicadores (SPI e DM)

# Resumo dos acumulados de chuva no estado de São Paulo

# Chuva por UGRHI em Janeiro de 2025

# Análise de dispersão – intervalo interquartil

- Precipitação pluviométrica acumulada do mês de análise comparada com o intervalo interquartil, calculado a partir da série histórica de dados do produto MERGE/Inpe;
- Faixa interquartil: valores entre o primeiro quartil (25%) e o terceiro quartil (75%).

# Análise de dispersão – intervalo interquartil

- Mapa construído a partir da análise de quartis aplicada na série de dados de chuva de cada UGRHI.

## Critérios:

- **Acima da faixa:** valor de chuva acumulada acima do terceiro quartil (75%)
- **Dentro da faixa:** valor de chuva dentro da faixa interquartil, ou seja, entre o primeiro quartil (25%) e o terceiro quartil (75%)
- **Abaixo da faixa:** valor de chuva acumulada abaixo do primeiro quartil (25%)

# Resumo do Índice de Precipitação Padronizado no estado de São Paulo

## Índice de Precipitação Padronizado

O Índice Padronizado de Precipitação (Standardized Precipitation Index - SPI) é uma ferramenta consistente de detecção e monitoramento probabilístico/padronizado de déficit ou excesso de precipitação para diferentes escalas temporais, possibilitando a comparação entre regiões com diferentes características climáticas. O índice é negativo para condições de déficit hídrico, nas quais a precipitação é inferior à média histórica (climatológica), e positivo para condições de excesso hídrico, que indicam precipitação superior à média histórica.

Sendo assim, o conhecimento do SPI pode fornecer informações importantes para a tomada de decisões quanto às medidas necessárias ao combate e a mitigação dos efeitos associados às secas e as enchentes.

## Outros indicadores e ano hidrológico

DM (Drought Magnitude): a magnitude da seca é a soma positiva do SPI para todos os meses dentro de um evento de seca, ou seja, meses consecutivos com  $SPI < -0,524$ .

Semestre úmido: Janeiro a março

Semestre seco: abril a Janeiro

# Classificação SPI

| Valores                    | Condição                | Probabilidade |
|----------------------------|-------------------------|---------------|
| $SPI \leq -2.326$          | Seca excepcional        | 1,0%          |
| $-2.326 < SPI \leq -1.645$ | Seca extrema            | 4,0%          |
| $-1.645 < SPI \leq -1.282$ | Seca severa             | 5,0%          |
| $-1.282 < SPI \leq -0.935$ | Seca moderada           | 7,5%          |
| $-0.935 < SPI \leq -0.524$ | Seca branda             | 12,5%         |
| $-0.524 < SPI < +0.524$    | Aproximadamente normal  | 40,0%         |
| $+0.524 \leq SPI < +0.935$ | Levemente úmido         | 12,5%         |
| $+0.935 \leq SPI < +1.282$ | Moderadamente úmido     | 7,5%          |
| $+1.282 \leq SPI < +1.645$ | Consideravelmente úmido | 5,0%          |
| $+1.645 \leq SPI < +2.326$ | Extremamente úmido      | 4,0%          |
| $SPI \geq +2.326$          | Excepcionalmente úmido  | 1,0%          |

# SPI-01 em Janeiro de 2025

SPI-01 se baseia na análise dos dados de precipitação do mês de Janeiro de 2025

# SPI-06 em Janeiro de 2025

SPI-06 se baseia na análise dos dados de precipitação dos últimos 06 meses.

# SPI-12 em Janeiro de 2025

SPI-12 se baseia na análise dos dados de precipitação dos últimos 12 meses (escala anual).

## Monitor de Secas

- Acompanhamento regular e periódico (mensal) da atuação da seca
- Classificação da seca por grau de severidade (5 categorias)
- Indicação de impactos (curto e/ou longo prazo)

Em São Paulo, devido às chuvas acima da normalidade em dezembro, houve recuo da seca moderada (S1) no norte e abrandamento da seca no oeste, passando de grave (S2) para moderada (S1). Os impactos são de curto prazo (C) no leste e de longo prazo (L) no restante do estado.
